

CCSC Eastern Programming Contest
Practice Problems

Hello Woof!

Background

Welcome to the programming contest! This training problem will help you practice submitting a program using the contest software.

A group of pets has arrived to cheer you on, and each pet would like a personal greeting. Your program must read their names from **standard input** and write a greeting for each one to **standard output**. (e.g. `input()` and `print()` in Python. `System.out` and `System.in` in Java)

For each name x , print `Hello, x` on its own line. For example, a pet named Waffles should receive the greeting `Hello, Waffles`.

Input

The first line contains an integer N , the number of names, where $1 \leq N \leq 1,000$.

Each of the next N lines contains one name. Each name is a single word containing **3 to 10 letters**, inclusive. Names contain only uppercase and lowercase English letters (A–Z and a–z). Names may repeat.

Output

Print N lines, one for each name in the order given. Each line must contain `Hello,` followed by the name exactly as it appears in the input.

There must be one space after the comma. Do not print quotation marks, prompts, or any additional text.

Example Input

```
5
Waffles
Pickles
SirBorks
```

Noodle
Fluffernut

Example Output

Hello, Waffles
Hello, Pickles
Hello, SirBorks
Hello, Noodle
Hello, Fluffernut

Add Two Numbers

Background

This training problem helps you practice reading integers from standard input and writing answers to standard output.

For each test case, read two integers and print their sum.

Python hint: `input()` returns a string. Convert each value to an integer using `int()`:

```
a = int(input())
b = int(input())
print(a + b)
```

Without the conversion, adding the strings "12" and "34" would produce "1234" instead of 46.

Java hint: Use a `Scanner` connected to `System.in`, and read integer values using `nextInt()`:

```
Scanner scanner = new Scanner(System.in);
int a = scanner.nextInt();
int b = scanner.nextInt();
System.out.println(a + b);
```

Include `import java.util.Scanner;` at the top of your Java source file, and put the reading and printing code inside your `main` method.

These examples process one pair of integers. Your complete program must first read the number of test cases, then repeat these steps for each test case. Do not print prompts asking for input.

Input

The first line contains an integer N , the number of test cases, where $1 \leq N \leq 100$.

Each test case consists of two lines:

- The first line contains an integer A .

- The second line contains an integer B.

Both integers satisfy $1 \leq A, B \leq 1,000$.

There are exactly $2N$ lines after the first line.

Output

For each test case, print the sum $A + B$ on its own line, in the order the test cases appear in the input.

Print only the sums, with no labels or additional text.

Example Input

```
3
12
34
1
1000
1000
1000
```

Example Output

```
46
1001
2000
```
